L4 ANSWER 83 OF 83 CAPLUS COPYRIGHT 2008 ACS on STN

ACCESSION NUMBER: 1959:34817 CAPLUS

DOCUMENT NUMBER: 53:34817
ORIGINAL REFERENCE NO.: 53:6237b-f

TITLE: Pyrimidines. III. Synthesis and some reactions of

5-ethynylpyrimidines

AUTHOR(S): Hull, R.

CORPORATE SOURCE: Imp. Chem. Ind. Ltd., Macclesfield, UK

SOURCE: Journal of the Chemical Society (1958) 3742-3

CODEN: JCSOA9; ISSN: 0368-1769

DOCUMENT TYPE: Journal LANGUAGE: Unavailable

cf. C.A. 52, 10099i. 5-Ethynyl-4-methyl-2-phenylpyrimidine (I) and the 2-Me2N analog (II) were prepared 5-Acetyl-4-methyl-2-phenylpyrimidine (III) was converted by PC15 into the 5-(1-chloroviny1) pyrimidine (IV), which with alc. KOH gave I. PC15 (37 g.) added slowly to 37 g. III in 200 ml. C6H6, the mixture refluxed 2 hrs., cooled, poured into ice and 250 cc. H2O, the aqueous phase neutralized with Na2CO3, stirred 0.5 hr., the C6H6 layer separated, and the exts. dried and distilled gave 36 g. IV, brown oil, b0.1 145°. IV (3.3 g.) in 15 ml. alc. refluxed 2 hrs. with 2.4 g. KOH in 15 ml. 95% alc., evaporated to dryness, H2O added, and the product extracted with Et20 gave 2 g. I, m.  $64-5^{\circ}$  (ligroine),  $\lambda$  280 m $\mu$ ,  $\epsilon$  26,500,  $\nu$  2.9 and 4.65  $\mu$ . Ammoniacal AgNO3 in 50% alc. added to 0.4 g. I in alc. gave the Ag salt. The infrared bands are attributed to the 5-CH.tplbond.CH group. I (2.04 g.) and 0.8 g. AcSH heated gently and left 7 days gave 2-(4-methyl-2-phenyl-5pyrimidinylvinyl)thiolacetate, b0.1 130°. These observations confirm the structure of I. II was prepared by a similar series of reactions from 5-acetyl-2-dimethylamino-4-methylpyrimidine (V). Dimethylguanidine sulfate (6.8 g.) and 7.85 g. AcCH2COCH: CHOEt added to a cooled solution of 1.15 g. Na in 20 ml. alc., the mixture refluxed 2 hrs., cooled, filtered, the filtrate evaporated to dryness, and the residue washed with H2O and recrystd. gave 7 g. V, needles, m. 56-7° (H2O); semicarbazone, m.  $226-7^{\circ}$  (alc.). V (2.58 g.) and 3 g. PC15 similarly refluxed 2 hrs. in C6H6 and separated gave 1.9 g. 5-(1-chloroviny1)-2-dimethylamino-4-methylpyrimidine (VI), b0.08 100°. VI (14.7 g.) in 50 ml. alc. heated under reflux 2 hrs. with 12.5 g. KOH in 80 ml. alc. gave 9.4 g. II, b0.1  $80-4^{\circ}$  as a dark red oil. II did not give a Beilstein test for halogen and formed a Ag salt with ammoniacal AqNO3. 101654-70-0P, Pyrimidine, 2-dimethylamino-5-ethynyl-4-methyl-

L4 ANSWER 82 OF 83 CAPLUS COPYRIGHT 2008 ACS on STN

ACCESSION NUMBER: 1967:507934 CAPLUS

DOCUMENT NUMBER: 67:107934

ORIGINAL REFERENCE NO.: 67:20315a,20318a

TITLE: Dimroth rearrangement. IX. Formation and

isomerizations of propynyl (and related)-

iminopyrimidines

AUTHOR(S): Brown, Desmond J.; England, B. T.

CORPORATE SOURCE: John Curtin Sch. Med. Res., Australian Natl. Univ.,

Canberra, Australia

SOURCE: Journal of the Chemical Society [Section] C: Organic

(1967), (19), 1922-7

CODEN: JSOOAX; ISSN: 0022-4952

DOCUMENT TYPE: Journal LANGUAGE: English

GI For diagram(s), see printed CA Issue.

cf. CA 67: 10969v. The insertion of a 5-allyl, a prop-2-ynyl, or a AB prop-1-ynyl substituent into 1,2-dihydro-2-imino-1,4,6-trimethylpyrimidine progressively decreases the basic strength and increases the rate of Dimroth rearrangement into the corresponding 4,6-dimethyl-2methylaminopyrimidine (I); similar effects follow replacement of the 1-methyl group in the same imine by such substituents. Condensation of 3-(prop-2-ynyl)acetylacetone with quanidine gives the expected 2-amino-4,6-dimethyl-5-(prop-2-ynyl)pyrimidine, but also the isomeric 5-(prop-1-ynyl) - and 5-allenylpyrimidines; other prop-2-ynylpyrimidines also suffer such prototropic changes which are unprecedented in the series. An alkaline solution of 1,2-dihydro-2-imino-4,6-dimethyl-1-(prop-2ynyl)pyrimidine undergoes two parallel isomerizations at comparable rates; one is a normal Dimroth rearrangement, and the other a cyclization to 2,4,6-trimethyl-1,3a,7-triazaindene. Evidence for some of the structures was obtained from 1H N.M.R. and uv spectra, which were also used to measure rates of rearrangement.

AB The use of a compound which binds at the tetrahydrobiopterin site of NO synthase for the treatment of conditions where there is an advantage in inhibiting neuronal NO synthase with little or no inhibition of endothelial NO synthase is disclosed. Pharmaceutical formulations comprising such compds., i.e., pyridinediamines, pyrimidinediamines and indazole derivs., and processes for their preparation are also disclosed. An example compound, 1-methyl-4-[5-(2,3,5-trichlorophenyl)-2-pyrimidinyl]-1-methylpiperazine (I) inhibited NO synthase in vitro (IC50 = 5.0  $\mu$ M). Another compound, 7-nitroindazole (II), inhibited NO synthase in mice (IC50 = 1  $\mu$ M).

AB The invention relates to novel 4,4-disubstituted cyclohexan-1-ol derivs. I [R1 = various sidechains; X = YR2, F, (un)substituted NH2; Y = 0, S(0)m; m = 0, 1, 2; X2 = 0, (un)substituted NH; X3 = H, as given for X; R2 = (poly)(halo)methyl or -ethyl; s = 0-4; W = alk(en/yn)yl; R3 = CO2H or esters or amides, (hetero)aryl(alkyl), etc.; Z = OH, SH, NH2, and their derivs.; with provisos]. The compds. are useful for treating allergic and inflammatory diseases (especially asthma), for inhibiting the production of tumor

necrosis factor (TNF), as antivirals and antifungals, and for reducing toxicity of antimicrobials such as amphotericin B (no data). For example, 4-[3-(cyclopentyloxy)-4-methoxyphenyl]-4-ethynylcyclohexan-1-one was reduced by NaBH4, and the resulting cis- and trans-cyclohexanol derivs.

were separated by flash chromatog. The trans-isomer was coupled with 4-bromopyridine using Pd(PPh3)4 and CuI to give title compound II. Prepns. of addnl. I and several related 3,3-disubstituted cyclohexanone derivs. are given.

The invention relates to novel 3,3-disubstituted cyclohexan-1-one derivs. I [R1 = various sidechains; X = YR2, F, (un)substituted NH2; Y = 0, S(0)m; m = 0, 1, 2; X2 = 0, (un)substituted NH; X3 = H, as given for X; R2 = (poly)(fluoro)methyl or -ethyl; s = 0-4; W = alk(en/yn)yl; R3 = CO2H or esters or amides, (hetero)aryl(alkyl), etc.; Z = oxo and N-containing or (thio)ketal derivs.; with provisos]. The compds. are useful for treating allergic and inflammatory diseases (especially asthma), for inhibiting the production of tumor necrosis factor (TNF), as antivirals and antifungals, and for reducing toxicity of antimicrobials such as amphotericin B (no data). For example, coupling of 4-[3-(cyclopentyloxy)-4-methoxyphenyl]-1,1-(ethylenedioxy)-4-ethynylcyclohexane (preparation given) with 2-bromopyridine in piperidine in the presence of Pd(PPh3)4, CuI, and PPh3, followed by deprotection with pyridinium tosylate in refluxing aqueous Me2CO, gave title compound II.

The title compds. [I; R1 = (CR4R5)nC(0)O(CR4R5)mR6 (wherein R4, R5 = H, C1-2 alkyl; R6 = H, Me, OH, etc.; m = 0-2; n = 1-4), (CR4R5)nC(0)NR4(CR4R5)mR6, etc.; R2 = Me, Et (optionally substituted by 1 or more halogens); R3 = COOH, N-disubstituted C(0)NH2, etc.; X = F, NR4R5, formyl amine, OR2, S(0)m'R2 (wherein m' = 0-2); X2 = O, (un)substituted NH; X3 = H, X; W = C2-6 alkyl, C2-6 alkenyl, C2-6 alkynyl; Z = OH, SH, etc.; s = 0-4], useful in treating asthma, allergy and inflammatory diseases, and for inhibiting the production of Tumor Necrosis Factor (TNF), were prepared Thus, reaction of trans-[4-(3-cyclopentyloxy-4-methoxyphenyl)-4-(2-pyridylethynyl)cyclohexan-1-ol] with 2-bromopyridine in the presence of Pd(PPh3)4, CuI, PPh3 in piperidine afforded 84% the title compound cis-II. In general, compds. I demonstrated a pos. in vivo response in reducing serum levels of TNF induced by the injection of endotoxin.

AB Title compds. I [R1 = wide variety of sidechains containing esters, amides, ethers, and a variety of functional groups; X = YR2, F, (di)(alkyl)amino, formylamino; Y = O, S, SO, SO2; X2 = O, NH, (fluoro)(alkyl)imino; X3 = H, X; Z = acyl, CO2H and derivs., NH2 and derivs., certain (un)substituted azoles; R2 = Me, Et, or their halo derivs.; R3 = H, alkyl, Ph, phenylalkyl, pyrimidyl(alkyl), imidazolyl(alkyl); R4 = H, acyl, CO2H or esters, CONH2 or derivs., OH or SH or derivs.] and their pharmaceutically acceptable salts are claimed, and approx. 140 examples were prepared As inhibitors of the enzyme PDE IV (no data), I are useful for treatment of allergy, inflammation, and asthma. As inhibitors of TNF (tumor necrosis factor) production in mammals (no data), I are also useful for treating viral infections (including HIV) and yeast or fungal infections which are sensitive to TNF. For instance, the acid II was prepared in 3 steps. Specifically, 2,2-dimethyl-1,3-dioxane-4,6-dione was condensed with 3-(cyclopentyloxy)-4-methoxybenzaldehyde to give the 5-benzylidene derivative (93%), which underwent alkynylation with PhC.tplbond.CLi (84%), followed by hydrolysis with aqueous HCl in dioxane, and thermal decarboxylation in AcNMe2 at 135° (82%), to give II.

5-Substituted-2,4-diaminopyrimidines, and agriculturally acceptable salts thereof, when present in insecticidally or acaricidally effective amts., and with a suitable agricultural carrier, are useful as active ingredients in novel insecticidal and acaricidal compns. These pyrimidines may be I wherein Ar = various (un)substituted Ph, pyridyl or pyridyl N-oxide derivs., and wherein U = alkenylene or alkynylene moiety, and R-R4 are independently selected from H, alkyl, cycloalkyl, arylalkyl, alkylcarbonyl, etc. Also disclosed and claimed are novel intermediate 2,6-diamino-5-iodopyrimidines II (R-R3 = H, alkyl, cycloalkyl, alkoxyalkyl, alkoxyalkoxyalkyl, arylalkyl, or R1R2 or RR3 form piperidine

or morpholine rings; R4 = H, lower alkyl), and the intermediate T-(U)-Ar (T=B(OH)2, trialkylstannyl; U=C3-C12 alkenylene or various substituted alkenylenes; Ar=various (un)substituted Ph, pyridyl or pyridyl N-oxide derivs.). Compds. I are particularly effective as pesticides in controlling Lepidoptera, e.g., tobacco budworm, and Coleoptera, e.g., Mexican bean beetle.

AB Several new pyrimidinylphenyldiacetylenes were prepared as potential new

mesogens having large birefringence values and poor mesomorphic properties. As one final step 2-ethynyl-5-heptylpyrimidine and

1-(p-cyanophenyl)-2-bromoacetylene were coupled using the

Cadiot-Chodleiewitcz method obtaining 4-[4-(5-heptyl-2-pyrimidinyl)-1,3-butadiynyl] benzonitrile. Transition temps. were determined by hot-stage polarizing microscopy at  $70.9-129.2^{\circ}$ . Melting enthalpy values were

determined by DSC at 21.9-39.0 kJ mol-1. Several pyrimidines decomposed at the clearing temps, and become yellow when exposed to light at room temperature

Immunol. agent bropirimine is a tetra-substituted pyrimidine with anticancer and interferon-inducing properties. Synthetic routes to novel 5-aryl analogs of bropirimine have been developed and their potential mol. recognition properties analyzed by mol. modeling methods. Sterically challenged 2-amino-5-halo-6-phenylpyrimidin-4-ones (halo = Br or I) are poor substrates for palladium catalyzed Suzuki cross-coupling reactions with benzeneboronic acid because the basic conditions of the reaction converts the amphoteric pyrimidinones to their unreactive enolic forms. Palladium-mediated reductive dehalogenation of the pyrimidinone substrates effectively competes with cross-coupling. 2-Amino-5-halo-4-methoxy-6phenylpyrimidines can be converted to a range of 5-aryl derivs. with the 5-iodopyrimidines being the most efficient substrates. Hydrolysis of the 2-amino-5-aryl-4-methoxy-6-phenylpyrimidines affords the required pyrimidin-4-ones in high yields. Semiempirical quantum mech. calcns. show how the nature of the 5-substituent influences the equilibrium between the 1Hand 3H-tautomeric forms, and the rotational freedom about the bond connecting the 6-Ph group and the pyrimidine ring. Both of these factors may influence the biol. properties of these compds.

Compds. were prepared with 4-butylsulfanylphenyl and 4-cyano- or 4-isothiocyanato-Ph units connected by -CH:CH-, -COO-, -C.tplbond.C-, or -C.tplbond.C-COO- linking groups. The synthesis of the novel compds. is presented and the transition temps. and optical parameters of the compds. are discussed and compared with those for related biphenyl reference systems. The ester linking group reduces optical and polarizability anisotropy, but the other linking groups give increased optical anisotropy (up to  $\Delta n$  = 0.50) and polarizability anisotropy [up to  $\Delta \alpha$  45.2Å3 (10-30 m3)].

(R4) n

AB A particle consisting of a solid dispersion comprising ≥1
pharmaceutically acceptable H2O-soluble polymers and a title compound, e.g.,
[I; Y = CR5, N; A = CH, CR4, N; n = 0-4; Q = NR1R2, H; R1, R2 = H, OH,
(substituted) alkyl, alkoxy, alkylcarbonyl, alkoxycarbonyl, aryl, etc.; or
R1R2 = atoms to form pyrrolidinyl, piperidinyl, morpholinyl, azido,
alkylaminoalkylidene; R3 = H, aryl, alkylcarbonyl, alkyl, alkoxycarbonyl,
alkoxycarbonylalkyl; R4 = OH, halo, alkyl, alkoxy, cyano, aminocarbonyl,
NO2, amino, trihalomethyl, trihalomethoxy, etc.; R5 = H, alkyl; L = X1R6,
X2AR7, etc.; R6, R7 = (substituted) Ph, indanyl, indolyl; X1, X2 = NR3,
NHNH, N:N, O, S, SO, SO2; A = C1-4 alkylene; with provisos], is claimed.
Thus, 5-bromo-2-chloro-N-(2,4,6-trimethylphenyl)-4-pyrimidineamine (preparation
given) was stirred with HCl in Et2O followed by evaporation of solvent,
addition

of 4-aminobenzonitrile and dioxane, and reflux for 4 days to give 2%  $4-[[5-chloro-2-[(2,4,6-trimethylphenyl)amino]-4-pyrimidinyl]amino]benzonitrile. Tested title compds. showed anti-HIV activity with IC50 = <math display="inline">0.0004-0.030~\mu M$ . A title compound melt extrudate was prepared using hydroxypropyl methylcellulose with no degradation of the active ingredient.

AB The synthesis and anti-HIV-1 activity of a series of diarylpyrimidines (DAPYs) are described. Several members, e.g. (I), of this novel class of non-nucleoside reverse transcriptase inhibitors (NNRTIs) are extremely potent against both wild-type and a panel of clin. significant single- and double-mutant strains of HIV-1.

 $R^3$ 
 $R^4$ 
 $R^4$ 

AΒ The title compds. (I) [wherein A = a bond, S, N(R), (CH2)2, CH:CH, C.tplbond.C, or O; X and Y = independently N:, :N, :CH, C(CN):, :C(CN), C(CSNH2):, or C(CSNH2), wherein at least 1 of X or Y is N; R1 = H, (cyclo)alkyl, alkenyl, alkynyl, halo, CN, (alkyl)carboxylates, (alkyl), carbamates, alkoxy(alkyl), phenoxy(alkyl), phenylamino(alkyl), (un) substituted phenyl(alkyl) or amino(alkyl), morpholinyl(alkyl), piperidinyl(alkyl), pyridinyl(alkyl), piperazinyl(alkyl), etc.; R2 = H, halo, CN, NO2, acyl, carboxylate, (un)substituted alkyl, alkenyl, alkynyl, or Ph; R3 = alkyl or thienyl, (dihydro)furanyl, benzodioxolyl, isoxazolyl, pyridinyl, dihydropyranyl, pyrazinyl, aryl(alkyl)oxy, pyrazolyl, (un) substituted Ph, etc.; R4 and R5 = independently H, benzoyl, or (un) substituted phenacyl; or A and R2 taken together the with the C atoms to which they are attached may form a substituted thienyl group] were prepared as adenosine receptor modulators. For example, treating 3,4,5-trimethoxybenzoylacetonitrile with to NaH in DMSO, followed by addition of CS2 and MeI, gave the bis(methylthio) intermediate. Cycloaddn. with quanidine nitrate in the presence of TEA in DMF afforded the pyrimidinenitrile (II), which exhibited high selectivity toward the A1 and A3 adenosine receptors compared to the A2 receptor with pKi values of 5.88, 5.71 and 7.24, resp. I are useful for the treatment of Alzheimer's disease, Parkinson's disease, neuroprotection, schizophrenia, anxiety, pain, respiration deficits, depression, asthma, allergic responses, hypoxia, ischemia, seizure, substance abuse, and sedation, and they may be active as muscle relaxants, antipsychotics, antiepileptics, anticonvulsants, and cardioprotective agents (no data). The most preferred indications for I are those which include disorders of the central nervous system, such as certain depressive disorders, neuroprotection, and Parkinson's disease.

AB Title compds. I [wherein Z = 0, NH, or S; m = 0-1; R1 = (un)substituted (alkyl)a((hetero)cycloalkyl or (hetero)aryl)b(alkyl)c; a, b, and c = independently 0-1 and a + b + c ≥ 1, with provisos; R2 = H, NH2, or NHCOR3; R3 = H or alkyl; X = (un)substituted aryl; and pharmaceutically acceptable esters, amides, salts, or solvates thereof] were prepared Pharmaceutical compns. which contain I, methods for their preparation, and their use in therapy, particularly in the treatment of neurodegenerative or other neurol. disorders of the central and peripheral nervous systems, including age related cognitive disorders such as senility and Alzheimer's disease, nerve injuries, peripheral neuropathies, and seizure disorders such as epilepsy, are disclosed. For example, 4-chloro-5-(4-chlorophenylethynyl)pyrimidine (preparation given) was coupled with (trans)-4-aminocyclohexanol•HCl using TEA and MeCN in CH2Cl2 to afford II. The latter increased the choline acetyltransferase (ChAT) activity

relative to nerve growth factor (NGF) alone with EC2x of 0.2  $\mu M$ . AB Compds. of the formula I [A = Ph, substituted five-membered aromatic ring containing 1 or 2 atoms selected from N, O, and S and the remaining atoms are carbon, or substituted 6-membered aromatic ring containing 1 or 2 nitrogen atoms

and the remaining atoms are carbon; R1, R2 = independently H, alkyl, cycloalkyl, hydroxy, amino, halo, haloalkyl, and perfluoroalkyl; R3 = optionally substituted alkyl, alkanoyl, carboxamido, cycloalkyl, cyclothioalkoxy, etc.; R4 = substituted N, O, or S] or therapeutically acceptable salts or prodrugs thereof were prepared Thus, Me 4-((4-((5S)-5-((acetylamino)methyl)-2-oxo-1,3-oxazolidin-3-yl)-2-fluorophenyl)ethynyl)benzoate (II) was synthesized in 6 steps from <math>(5R)-5-((hydroxymethyl)-1,3-oxazolidin-2-one (III). Oxazolidinones of formula I are useful for treating bacterial infections, psoriasis, arthritis, and toxicity due to chemotherapy. Preparation of the compds., compns. containing the compds., and treatment of diseases using the compds. are disclosed.

AB Carbon-14 labeled SB 222618 and SB 242126, which are potential phosphodiesterase type 4 inhibitors for the treatment of asthma, were synthesized. Two routes were proposed for potentially rapid production of SB 222618-[14C]. The first route was based on the use of the readily available [14C]methyl iodide as the carbon-14 source, while the second involved preparation of 5-bromo-2-aminopyrimidine in C-14 labeled form starting from [14C]guanidine. SB 242216-[14C] was obtained by converting SB 222618-[14C] using Mitsunobu type chemical Deuterium labeled SB 222618 and tritium labeled SB 242126 were also prepared

AB Title compds. I [R1 = H, alkyl; R2 = (un)substituted alkyl; R3 = H, alkyl; R4 = (un)substituted alkyl; R5 = halo] and their pharmaceutically acceptable salts were prepared For example, condensation of thiocyanatopyrimide II, e.g., prepared from 3,4-dichloroaniline and 2-chloro-4-thiocyanato-5-nitropyrimidine in one step, and acetylaminoethylamine provided trisubstituted pyrimidine III in 88% yield. In CDK1/CyclinB1 kinase inhibition studies, 88-examples of compds. I exhibited IC50 values more than 100 nM. Compds. I are claimed useful for the treatment of diseases characterized by abnormal cell proliferation.

AB A general method has been developed to control the selective rearrangement of Meijer's AADD quadruply hydrogen-bonded homodimers by introducing an addnl. donor-acceptor interaction. Therefore, one donor-assembling monomer, 1, in which the electron-rich bis(p-phenylene)-34-crown-10 moiety is connected to the hydrogen-bonding moiety, and two acceptor-assembling monomers, 2 and 3, in which the electron-deficient pyromellitic diimide or naphthalene diimide group is incorporated, resp., are synthesized and characterized. 1H NMR and 2D-NOESY studies show that all these compds.

exist as stable homodimers in chloroform. Mixing 1 equiv of 1 with 1 equiv of 2 in chloroform leads to the formation of heterodimers  $1\cdot 2$ in ≈60% yield, as a result of the electrostatic interaction between the bis(p-phenylene)-34-crown-10 moiety of 1 and the pyromellitic diimide group of 2. Selective formation of heterodimer 1.3 (>97%)was achieved by mixing 1 equiv of 1 with 1 equiv of 3 in chloroform which resulted in a strengthened electrostatic interaction between the bis(p-phenylene)-[34]crown-10 moiety of 1 and the naphthalene diimide group of 3. The structures of heterodimers  $1 \cdot 2$  and  $1 \cdot 3$ , which have been characterized by 1H NMR and UV/Vis expts., reveal a remarkable promoting effect between the donor-acceptor interaction and intermol. hydrogen-bonding. 1H NMR studies also reveal that heterodimers  $1 \cdot 2$  and  $1 \cdot 3$  can be fully and partially dissociated by addition of heterocycle 29, leading to the formation of new more robust heterodimers  $1 \cdot 29$  and  $2 \cdot 29$ , or  $3 \cdot 29$ , resp., and partially regenerated by subsequent addition of heterocyclic compound 30 through the formation of a new heterodimer  $29 \cdot 30$ . Heterodimers  $1 \cdot 2$  and 1.3 represent a novel class of pseudo[2]rotaxanes constructed by two different noncovalent interactions.

PUBLISHER: Society for the Study of Reproduction

DOCUMENT TYPE: Journal LANGUAGE: English

The anti-inflammatory and utero-relaxant effects of two potent AΒ

phosphodiesterase 4 (PDE4) inhibitors of the latest generation: cilomilast (one of the most advanced PDE4 inhibitors in clin. development, reportedly more selective for PDE4D) and compound A (which displays 12-fold greater selectivity toward PDE4B and/or PDE4A than toward PDE4D) were evaluated in human uterine smooth muscle. We first established that these compds. exhibit greater efficacy in inhibiting total cAMP-PDE activity in pregnant vs. nonpregnant myometrium (Emax =  $78.0\% \pm 3.6\%$  and  $80.3\% \pm 2.2\%$  in pregnant vs.  $57\% \pm 4.7\%$  and  $70.5\% \pm 5.9\%$  in nonpregnant women for compound A and cilomilast, resp.; P < 0.05 for both compds.), confirming the prominent participation of PDE4 isoforms in cAMP hydrolysis in the near-term pregnant myometrium. Using pregnant myometrial explants, we have shown that both these drugs and also rolipram, the prototype PDE4 inhibitor, produce concentration-dependent inhibition of lipopolysaccharide (LPS)-induced tumor necrosis factor alpha (TNF $\alpha$ ) release with similar potency in each case (pD2 =  $8.0 \pm 0.5$ ,  $7.9 \pm 0.2$ , and 7.6 $\pm$  0.2 for compound A, cilomilast, and rolipram, resp.). The maximum inhibition produced is 65%. Pretreatment with forskolin or 8-bromo-cAMP mimics the PDE4 inhibitor effect. Furthermore, compound A and cilomilast both produce concentration-dependent inhibition of the spontaneous contractions of myometrial strips and are more potent in pregnant than in nonpregnant myometrium (pD2 =  $7.3 \pm 0.7$  and  $8.1 \pm 0.3$  in pregnant vs.  $6.2 \pm$ 0.9 and  $6.6 \pm 0.1$  in nonpregnant myometrium for compound A and cilomilast, resp.; P < 0.05 for both compds.). This demonstrates that the PDE4 isoforms involved in the mechanism of contraction are different in the pregnant and nonpregnant myometrium. Our study highlights the importance of developing PDE4 inhibitors for the pharmacol. management of infection-induced preterm labor.

Thus, e.g., II was prepared

via amidation of 3-bromo-4-fluorobenzoic acid with L-threonine Me ester hydrochloride followed by substitution with hydroxylamine hydrochloride. This invention pertains generally to treating infections caused by gram-neg. bacteria. More specifically, the invention described pertains to treating gram-neg. infections by inhibiting activity of UDP-3-O-(R-3-hydroxydecanoyl)-N-acetylglucosamine deacetylase (LpxC). Many of I displayed an IC50 value of less than 10  $\mu \rm M$  with respect to inhibition of LpxC.

AB Title compds. I [wherein A1 = (un)substituted monocyclic or bicyclic heteroaryl; R1 = H, alk(en)yl, acyl, aryloxycarbonyl, alkyloxycarbonyl, trialkylsilyl; X, Y = independently H, halo, CN, alkyl, alkylcarbonyl, alkoxycarbonyl, NO2, OH and derivs., NH2 and derivs., SO2NH2 and derivs., etc; W = H, halo, cyclo/alkoxy/halo/hydroxy/alkyl, alkenyl, alkynyl, CN, NO2, SH and derivs., NH2 and derivs., SO2NH2 and derivs., heteroaryl, etc.; WCCX, or WCCY = (un)substituted aryl ring containing up to three heteroatoms; and their pharmaceutically acceptable salts, esters, amides, or prodrugs] were prepared as cyclin-dependent kinases 4 (cdk4) inhibitors. For example, II was prepared by cyclocondensation of guanidine III with 2-Cyclopentyl-6-hydroxymethylene-3-methoxycyclohex-2-en-1-one, dehydrogenation, and BOC-deprotection. II selectively inhibited cdk4 over cdk2 with IC50 values of 0.004 μM and 1.7 μM, resp. Thus, I and their formulations are useful for treating cell proliferative disorders, such as cancer, atherosclerosis, and restenosis (no data).

AB The ability of endogenous neurotrophins, including nerve growth factor (NGF), to promote the survival and development of neurons provides convincing evidence for their therapeutic potential, despite significant barriers to their successful clin. use. Many of these barriers might be surmountable, however, by strategies that enhance endogenous neurotrophin signaling. We evaluated a series of substituted pyrimidines for their ability to enhance the effects of NGF. KP544 [2-amino-5-(4chlorophenylethynyl)-4-(4-trans-hydroxycyclohexylamino) pyrimidine] amplified NGF-induced neurite outgrowth of PC12 cells approx. 2-fold at 2  $\mu M$ . KP544 also enhanced choline acetyltransferase activity, a marker of differentiation induced by either NGF or by cAMP, by 3- to 8-fold, with a 2-fold amplification at  $0.12-0.3 \mu M$ . This amplification occurred at all concns. of NGF used including those that maximally stimulated the cells. KP544 did not increase the levels of phosphorylated mitogen-activated protein kinases (MAPK) above that seen with NGF alone. These studies suggested that KP544 functions within the cell at a site that is downstream from or independent of MAPK signaling. NGF-induced neurite outgrowth in a human cell line (SH-SY5Y neuroblastoma cells) was also enhanced with  ${\rm KP544}$  treatment. Primary embryonic rat cortical cultures were used to extend the observations beyond the studies with the immortalized cell lines. In addition to effects on neurite outgrowth, KP544 protected these cells from glutamate-induced death. Overall, the data suggest that KP544 can selectively interact in the differentiation pathway

downstream of MAPK in a manner that amplifies nerve growth factor and cAMP effects and is also neuroprotective.

DOCUMENT TYPE: Journal LANGUAGE: English

In cultured cells, KP544 [2-amino-5-(4-chlorophenylethynyl)-4-(4-trans-AB hydroxycyclohexyl amino) pyrimidine] amplifies differentiation initiated by nerve growth factor (NGF) or cAMP. This report describes the pharmacokinetics, safety, and neuroprotective efficacy of KP544 in rats. After an oral dose of 10 mg/kg KP544 was 25% bioavailable with a plasma half-life of 1.3 h and brain levels 6-fold higher than plasma levels at 4 and 8 h post-dose. In a safety study, daily oral dosing for 30 days at 10 and 100  $\mbox{mg/kg}$  was well tolerated. The favorable pharmacokinetic and safety profiles, together with its amplification of NGF in vitro, prompted evaluation of  ${\rm KP544}$  in two models involving NGF deficiencies. In the first model, brains were lesioned with intrastriatal injections of quinolinic acid. KP544 at oral doses of 0.02 to 1.0 mg/kg/day almost completely prevented the resulting learning deficits as evaluated using a radial-arm-water maze. At the lowest dose, there was a slower onset of functional improvement. These effects were accompanied by redns. (16-34%)

in the striatal lesion size that were greatest at the highest dose and comparable to those seen with NGF therapy. The second model involved a peripheral neuropathy induced by taxol that is associated with decreases in NGF. KP544 at oral doses of 0.1--10~mg/kg/day decreased the severity of the neuropathy as measured by caudal nerve conduction velocities (30--70% return to control values). In both models, KP544 had a large therapeutic index suggesting its potential as a new approach for treating clin. disorders involving deficiencies in NGF.

AB Title compds. I [wherein R1, R2 = H, alkyl, alkanoyl; R3, R4 = H, alkyl, alkoxy; R5 = cyclopropyl, halo, cyano; m, n = 0-3; R6 = halo, oxo, cyano; etc., or salts thereof] were prepared as inhibitors of Tie2 receptor tyrosine kinases. Processes for the synthesis of I and some intermediates involved are claimed. For example, 2-amino-5-iodopyrimidine underwent Pd-catalyzed coupling with 3-ethynylaniline in the presence of CuI. The resultant substituted aniline was condensed with a carbamate, which was obtained from Ph chloroformate and 5-amino-3-methylisoxazole, to give urea II. This compound showed inhibition against Tie2 receptor tyrosine kinase in vitro and inhibition of autophosphorylation of Tie2 receptor tyrosine kinase with IC50 values of 19.871  $\mu$ M and 0.337  $\mu$ M, resp. Therefore, I and their pharmaceutical compns. have potential use in the production of an anti-angiogenic effect in a warm-blooded animal.
